

Raised Floor & Control Room Solutions

Raised Access Floor Systems

Engineered Flooring Solutions for Modern Technical Environments

We supply and install high-performance Raised Access Floor Systems designed to provide flexible, organized, and efficient infrastructure management for commercial, industrial, and mission-critical facilities. Our raised flooring solutions create an accessible under floor void for power distribution, data cabling, HVAC airflow, and other building services while maintaining a clean, professional, and adaptable workspace.

Our systems are manufactured to meet international quality standards and are suitable for data centers, control rooms, command centers, offices, telecom facilities, electrical substations, and industrial automation environments.

What is a Raised Access Floor?

A Raised Access Floor consists of modular floor panels supported by adjustable pedestals, creating an elevated floor space above the structural slab. This concealed service zone allows easy routing and maintenance of electrical, communication, instrumentation, and HVAC systems without disrupting operations.

Key Benefits

- Flexible cable and service management
- Easy access for maintenance and upgrades
- Improved airflow distribution
- Enhanced workspace organization
- Reduced downtime during modifications
- Increased safety and aesthetics
- Adaptable for future expansion
- High load-bearing performance

ARCHITECTURAL RAISED FLOOR SYSTEMS

TECHNICAL SPECIFICATIONS & APPLICATION MATRICES

This Section defines the technical structural criteria, core composition layers, and specialized architectural finishes for eight distinct engineered access floor profiles. Each configuration is optimized for targeted thermal, structural, acoustic, and static-dissipative performance required by modern industrial and commercial facilities.

1. Data Center System

Recommended Floor Type	Heavy-Duty Steel Cementitious Panel + High-Flow Perforated Airflow Panels
Top Finish & Coating	Anti-Static High-Pressure Laminate (HPL) with integral edge banding
Core Architecture Layers	1. Top Tier Anti-Static HPL wear surface 2. Die-formed, deep-drawn structural steel bottom pan (dome shape) 3. Lightweight, advanced solid cementitious core filler matrix 4. Flat steel top sheet electro-welded to the bottom pan
Primary Application Case	Mission-critical data centers, server farms, and heavy rack infrastructure corridors requiring managed underfloor cooling distribution.

2. Control Room System

Recommended Floor Type	Steel Cementitious Composite Rigid Panel System
Top Finish & Coating	Premium High-Pressure Laminate (HPL) Finish (Acoustic and Scratch Resistant)
Core Architecture Layers	1. Heavy-wear commercial grade High-Pressure Laminate (HPL) top sheet 2. Rigid top steel plate structural tier 3. High-density foaming structural cement core insulation layer 4. Corrugated protective bottom steel plate with anti-corrosive primer
Primary Application Case	Continuous monitoring rooms, SCADA centers, power plant main control desks, and facility management hubs.

3. Command Center System

Recommended Floor Type	High-Density Calcium Sulphate Panel System
Top Finish & Coating	Premium Heavy-Traffic Modular Carpet Tile Finish
Core Architecture Layers	1. Modular textile carpet tile overlay (interlocking or magnetic backed) 2. Galvanized steel sheet encapsulation layer (0.5mm top layer) 3. Monolithic non-combustible fiber-reinforced high-density calcium sulphate core 4. Galvanized steel sheet bottom backing plate for maximum deflection control
Primary Application Case	Military operation centers, emergency dispatch hubs, premium corporate boardrooms, and executive visual intelligence centers.

4. Telecom Room System

Recommended Floor Type	Steel Cementitious Pedestal Access System
Top Finish & Coating	Conductive Homogeneous Vinyl Tile Finish (Static Dissipative ESD)
Core Architecture Layers	1. Static-dissipative conductive homogeneous tile finish with copper grounding strips 2. Cold-rolled structural solid steel flat top plate 3. Ultra-dense structural setting compound cement matrix core 4. Die-formed spherical multi-pocket structural steel bottom tray
Primary Application Case	Telecommunication switching stations, cellular network baseline facilities, and digital PBX server closets.

5. Clean Room System

Recommended Floor Type	Precision Solid or Perforated Die-Cast Aluminum Raised Floor System
Top Finish & Coating	Specialized Clean-Room Grade Conductive Epoxy or Electroless Nickel Plating
Core Architecture Layers	1. Ultra-smooth chemical and abrasion-resistant conductive epoxy finish layer 2. Monolithic single-source die-cast structural aluminum alloy top face plate 3. Integrated orthogonal vertical reinforcing ribs (cast as one single structure piece) 4. Completely core-free, hollow layout to prevent particulate contamination or degassing
Primary Application Case	Semiconductor microelectronics fabrication facilities, pharmaceutical manufacturing spaces, and biomedical research clean labs.

6. Industrial Plant System

Recommended Floor Type	Ultra Heavy-Duty Extra-Thick Steel Cementitious Access System
Top Finish & Coating	Thick Anti-Wear Protective Galvanized Steel Shell or High-Impact Powder Coat
Core Architecture Layers	1. High-gauge heavy-duty galvanized structural steel cover plate surface 2. Premium high-tensile strength interior reinforcing steel plate matrix 3. High-density, micro-fiber reinforced structural concrete core filler slurry 4. Deep-stamped solid structural steel base tray profile
Primary Application Case	Light factory assembly lines, test laboratory floors with rolling equipment, and high-load industrial fabrication facilities.

7. Electrical Substation System

Recommended Floor Type	High-Load Electrostatic Discharge (ESD) Rigid Pedestal Floor System
Top Finish & Coating	Heavy-Duty High-Voltage Isolation Static-Control ESD Finish (Vinyl or HPL variant)
Core Architecture Layers	1. Ultra-thick technical grade ESD tile wear surface layer with conductive backing 2. Premium solid steel continuous top containment structural pan 3. Fiber-reinforced mineral compound or ultra-dense solid cement core insulation layer 4. Reinforced mechanical interlocking heavy steel frame perimeter structure
Primary Application Case	High-voltage transformer rooms, switchgear distribution vaults, and electrical equipment bays.

8. Office Building System

Recommended Floor Type	High-Density Calcium Sulphate Core or Premium High-Density Woodcore Panels
Top Finish & Coating	Bare Galvanized Steel Enclosure (Designed for subsequent loose-laid modular carpet or premium LVT overlays)
Core Architecture Layers	1. Factory bare structural galvanized steel sheet outer shell enclosing all faces 2. Premium high-density organic woodcore particle board OR mineral calcium sulphate core plate 3. High-bonding technical compound structural adhesive binding interface layer 4. Interlocking perimeter mechanical corner-lock or gravity-laid stringer support matrix
Primary Application Case	Commercial general multi-story corporate office blocks, administrative complexes, open-plan call centers, and banking workspace layouts.
